

Table 1: MRIO accounting framework. Each Final Demand column shows one column of Θ , partitioned by sourcing region: β_{1r} (EU-sourced, row 1) and β_{2r} (RoW-sourced, row 2), where first subscript = sourcing region s , second = spending region $r \in \{1, 2\}$. Column header c_r (g_r , id_r) is the scalar multiplying that column of Θ ; together they yield $\mathbf{d} = \Theta \text{vec}(\mathbf{F})$ (eq. 2.3). σ , ι defined analogously for government and investment channels. W =wages; P =profits; T =taxes; VA =value added.

		Intermediate Demand (ID)		Final Demand (FD)						Total FD
		EU	RoW	EU			RoW			
				HH	Gov.	Inv.	HH	Gov.	Inv.	$\mathbf{d}$
Industry Output	Z_1 (EU)	Z_{11}	Z_{12}	$\begin{pmatrix} \beta_{11} \\ \beta_{21} \end{pmatrix} c_1$	$\begin{pmatrix} \sigma_{11} \\ \sigma_{21} \end{pmatrix} g_1$	$\begin{pmatrix} \iota_{11} \\ \iota_{21} \end{pmatrix} id_1$	$\begin{pmatrix} \beta_{12} \\ \beta_{22} \end{pmatrix} c_2$	$\begin{pmatrix} \sigma_{12} \\ \sigma_{22} \end{pmatrix} g_2$	$\begin{pmatrix} \iota_{12} \\ \iota_{22} \end{pmatrix} id_2$	$\mathbf{d}_1$
	Z_2 (RoW)	Z_{21}	Z_{22}							$\mathbf{d}_2$
Value Added	Wages	W_1	W_2							
	Profits	P_1	P_2							
	Taxes	T_1	T_2							
Total VA		VA_1	VA_2							
Total Input		$\mathbf{d}_1^\top$	$\mathbf{d}_2^\top$
