

Scenario Registry

Scenario		Channel	Primary → Secondary Substitution	.	Transmission Regime
	Sc1	Final Demand	Meat → Other food products	0.20	Production Leakage
	Sc2	Household Consumption	Fossil electricity → Renewables	0.20	Fossil Import Collapse
	Sc3		Virgin wood → Recycled wood	0.20	Symmetric Contraction
	Sc4		Virgin plastics → Recycled plastics	0.20	Production Leakage
	Sc5	Firm Investment	Construction → Recycled aggregates	0.05	Construction Rebound
	Sc6		Primary metals → Recycled metals	0.20	Symmetric Contraction
	Sc7	Intermediate Demand	Virgin wood → Recycled wood	0.20	Symmetric Contraction
	Sc8	Firm Production	Virgin pulp → Recycled pulp	0.20	Symmetric Contraction
	Sc9		Virgin plastics → Recycled plastics	0.20	Production Leakage
	Sc10		Primary metals → Recycled metals	0.20	Competitive Displacement
	Sc11		Virgin glass → Recycled glass	0.20	Symmetric Contraction
	Sc12		Cement → Recycled clinker	0.20	Symmetric Contraction
	Sc13		Fossil electricity → Renewables	0.20	Fossil Import Collapse
	Sc14		Construction → Recycled aggregates	0.05	Construction Rebound

..= substitution intensity (share of primary demand shifted to secondary sector per period). Construction scenarios (Sc5, Sc14) use ..=.0.05 due to the larger scale of the investment channel. Bullet colour identifies each scenario (matches Figures 8–9). Badge colour denotes transmission regime (matches shaded areas in Figure 10).
